

Aggregating into a switch IRF

Overview

Consolidates management of multiple, discrete devices into a single, easy-to-manage, virtual switch fabric. All of the switches have the same routing table and can route packets received from. This tutorial is based on the HP 5920AF-24XG Switch (JG296A) but it can be used also with 51xx/55xx switches. With IRF, you can virtualise all physical switches to one virtual-switch, so you have one. When uplinking a pair of A Series configured as IRF to another pair of A Series configured as IRF with SFP and 1Gbe fiber can links be aggregated across the switches thereby. IRF virtualization technology offers processing power, interaction, unified management, and uninterrupted maintenance of multiple. Core switches set up a CSS that functions as the core of the entire campus network to implement high network reliability and forwarding of a large amount of data. IRF overcomes the limitations of traditional STP (Spanning Tree Protocol) based and.
