

# **Concept of Access Aggregation Core Switch**

## Overview

---

As the aggregation point of access switches, the aggregation switch is required with the ability to process the access layer information and submits it to the upstream chain of the core layer. This article looks at what each such tool does, compares how they differ from each other, and offers suggestions as to what sort of network each. These three layers focus on Some specific functions: The core layer is mainly used for the high-speed switching backbone of the network, the convergence layer focuses on providing policy-based connections, and the access layer is responsible for connecting workstations including computers and APs. Quality of Service (QoS): Quality of Service (QoS) is essential in core switches. Since the networks are highly demanding and a massive amount of data passes through the core layer, the QoS enables the selective transmission of data.
