

Control line routing conduit or cable tray

Overview

The pathway is the plan, the trays and conduits are the buckets which contain the wires. Choosing the right pathway for power and data cabling affects everything from installation speed to long-term reliability. Generally instrument cabling is usually run in multicore cables from the control room to the plant area (either below or above the ground) and then from field junction boxes in single pairs to the field measurement or actuating devices. Cable trays are open structures designed to hold and support cables along pathways.
