

# **Distance between cable inlet and outlet of distribution box**

## Overview

---

The maximum length of LAN copper horizontal distribution cable is 90 meters (295 ft) from the work station outlet to the Telecommunications Closet (TC) patch panel, no exceptions. Where this length would be exceeded the designer will add additional TCs as required. In industrial power distribution systems, cable distribution boxes (also known as power distributor boxes, distribution electrical boxes, or electrical power distribution boxes) are the core hub of power transmission, branching, and protection. The National Electrical Code (NEC), published as NFPA 70, sets minimum safety standards for electrical junction boxes in residential and commercial buildings. Every state has adopted some version of the NEC, though the specific edition in force and any local amendments depend on your jurisdiction's. 30 says that NM cable has to be supported "within 300 mm (12 in) of every outlet box". from the box?

Is it acceptable to leave a bit of slack in the cable, so that along the cable it might be more like 18 in.

## **Basics Of Air Distribution**

---

Like all boxes, dual duct boxes have a discharge that's ducted to the diffusers or grilles in the space. The difference is that a dual duct box has two supply inlets (yes, two!) ducted to the supply air system.
