

Distinguishing between fiber optic and wired routers

Overview

A fiber router is designed to work specifically with fiber optic internet connections, providing faster and more reliable speeds compared to a normal router that typically works with traditional broadband connections. They are not competing options; instead, they work together to create a high-performance network. Fiber cable modems and optical routers are essential components of modern broadband connectivity, providing fast and reliable internet access. Instead of a traditional modem, fiber internet requires an Optical Network Terminal (ONT) that converts light signals into electrical signals your devices can understand.
