

Does a 50-meter pigtail affect internet speed

Overview

As Ethernet cable length increases, signal degradation or attenuation occurs, leading to slower network speeds, increased packet loss, and potential errors. This 10-meter allowance for patch cords is critical for practical flexibility and is a key consideration in structured cabling design. A cable that works perfectly for basic internet at 100 meters might fail completely for high-speed file transfers at the same distance. The "skin effect" pushes electricity to the outer edge of the copper wire at high frequencies, increasing resistance and heat. Even if your partition walls between townhomes are brick or concrete, the interior. Cable run limitations and types like Cat5e, Cat6, and Cat6a affect how fast data moves.

Will a 50m ethernet cable cause speed loss? : r/HomeNetworking

It depends on what speed you are getting from your ISP. But CAT6 will do 1/2.5/5Gbps at 50m. So if your Internet connection is under 5Gbps, you won't have any speed loss.

All of them will connect at exactly the same speed, and at a piddling 25 meters, even Cat5e would connect at 10 gigabit (which is 10x the speed of your fiber internet service) at the same
