

Does an optical module need copper foil

Overview

In optical module designs, only the outer layer has a copper layer; the inner layer does not. Modern data centers and HPC clusters are built on the principles of maximum density. The composition of PCB copper foil consists of copper metal, which is known for its excellent electrical conductivity. Copper foil is the conductive heart of PCBs, enabling signal flow in everything from smartphones to industrial equipment. In today's fast-paced world of electronics, where we're surrounded by gadgets that power our daily. Critical Metrics: Signal integrity (insertion loss, return loss) and thermal management are the two.
