

How much butterfly-shaped optical cable should be reserved

Overview

In order to ensure the safety of the optical cable, the reserved optical cable should be left in the man (hand) hole of the communication pipeline as much as possible. Butterfly cables almost universally use bend-insensitive single-mode fiber — specifically types covered by the ITU-T G. They are called butterfly-shaped due to their unique design, which features a flat shape with two parallel fiber ribbons running down the center. • Fiber optic cables are often custom cut to match required lengths for each cable run, or you can order a reel matching your total length and cut segments yourself.
