

# **How to connect fiber optic cables to power equipment lines**

## Overview

---

This technique takes a small, lightweight fiber optic cable and wraps it around or lashes it to the power line. There are two types of these cables, OPGW (optical power ground wire) and OPPC (Optical power phase conductor) cables. Most aerial fiber optic cables are installed by lashing to a steel messenger wire strung between poles, but there is a category of cables with special high-strength jacket designs called all-dielectric self-supporting (ADSS) cables. Obviously, these fiber cables need to be resistant to electricity, which can be difficult as many aerial cables contain high tensile steel (HTS) for tensile strength. On long runs, use proper lubricants and make sure they are compatible with the cable jacket. This guide will explain the entire set of activities involved in installing Fiber optic cable contractors -from the early planning stage right through testing-for facility managers, IT teams, and low-voltage contractors to build high-performance networks safely and efficiently.
