

# **How to connect two cores of indoor optical fiber cable**

## Overview

---

The ideal structure for connecting two fiber cables is as follows: Cable A → Adapter Panel → Patch Cord → Adapter Panel → Cable B

**How It Works**

**Fiber Adapters:** Bridge the two connector types (e.g., LC to SC). The safest and most standardized way to connect two terminated fibers inside a cabinet is by using patch cords and adapters. This approach maintains network performance while allowing flexible reconfiguration. According to the IBDN standard, we generally recommend using 12 cores for the communication room in each building, and 24 cores for the building room. Connect the single-mode transmitter or device to the single-mode end of the patch cord.
