

How to sort the beam splitters

Overview

A beam splitter or beamsplitter is an that splits a beam of into a transmitted and a reflected beam. It is a crucial part of many optical experimental and measurement systems, such as, also finding widespread application in. Beam splitters are classified by construction (plate, cube, pellicle, polka dot) and by function (standard, non-polarizing, polarizing, dichroic). a laser beam) into two (or sometimes more) beams, which may or may not have the same optical power (radiant flux). See the Comprehensive Guide for worked examples, SVG diagrams, and full references.
