

How to wire the ground wire in a power distribution cabinet

Overview

Always connect the ground wire from the system to a dedicated grounding rod, driven at least 8 feet into the earth. Grounding is a mechanism to protect distribution equipment and people under normal operating conditions, abnormal operational (overcurrent and overvoltage) responses, and hazardous conditions such as shocks. However, the idea is always the same - electrical devices are not allowed to interfere with each other. It is created by connecting the neutral point of an installation to the general mass of the earth or a chassis.
