

# **Network Rack Grounding Detection**

## Overview

---

To ground a server rack, identify the grounding point, which is typically a metal stud or terminal on the rack's frame or chassis. The main purpose of grounding data racks is to secure people from the harmful influence of electric circuits and prevent health problems, death in the case of serious damage to telecommunication systems. The TIA and ANSI, international institutions for standardization, certification, standardize the requirements for manufacturers to produce physical machines in accordance with the set rules. The ANSI/TIA-942 standard is aimed at regulating the maintenance of network systems and data centers.
