

Optical Module Temperature Reporting

Overview

Mainstream optical modules nowadays are generally equipped with Digital Diagnostic Monitoring (DDM) functions. Each module is preset with internal temperature thresholds in accordance with MSA (Multi-Source Agreement) requirements and reports the shell temperature in real time. But now, advanced applications such as artificial intelligence (AI) and machine learning are taking high data processing demands to the next level — and legacy cooling solutions for I/O modules may no longer be enough. In a world of optical access networks, where data speeds soar and connectivity reigns supreme, the thermal management of optical transceivers is a crucial factor that is sometimes under-discussed. As the demand for higher speeds grows, the heat generated by optical devices poses increasing. Modern, responsive UI built for real-time troubleshooting with customizable dashboards and advanced visualization capabilities. Native iOS and Android apps bring full monitoring capabilities to your mobile device with real-time alerts and notifications.
