Procurement of QSFP-DD Aggregation Switches

Overview

Key Takeaways for 2025 Procurement: Verify Host FEC Support: Ensure your switches support RS (544) FEC for PAM4 optics. Thermal Headroom: Choose OSFP for 800G+ AI clusters; stick to QSFP-DD for standard data centers. However, as the evaluation progressed, it became evident that not all switches labeled as "400G-ready" guarantee QSFP-DD backward. QSFP-DD pricing creates significant challenges for buyers due to the extreme opacity of the market. Standard procurement guides list endless catalog numbers without valuable context, overwhelming engineers with technical specifications while completely obscuring actual market costs. The core difference between SFP and QSFP is lane count: SFP is a single-lane form factor (1G–25G), while QSFP aggregates 4 (or more) lanes to reach 40G, 100G, 200G and 400G (QSFP-DD). SFP, SFP+, QSFP, QSFP28, and QSFP-DD differ in bandwidth, lane architecture, physical size, power draw, and upgrade path. SFP-family modules are best for lower-speed edge and server links, QSFP-family modules serve higher-density aggregation and spine-leaf networks, and QSFP-DD is designed for 400G.
