

Regular switches and PoE switches can be used simultaneously

Overview

A typical PoE switch includes an uplink port that allows it to connect upstream to a non-PoE core or aggregation switch without issues. PoE (Power over Ethernet) technology allows switches to deliver both power and data over a single Ethernet cable—perfect for powering devices like IP cameras, VoIP phones, and wireless access points. PoE devices are network equipment that can send out or receive the PoE power along with data, such as PoE switches, IP cameras, wireless access points, while non-PoE devices can only. 3af/at standard and can simultaneously transmit data and power through 4/5/7/8 cores or 1/2/3/6 cores of Ethernet cables. While both serve the same basic function of connecting network devices, a PoE switch offers built-in Power over Ethernet (PoE) capabilities that can significantly simplify deployment and reduce costs in certain scenarios.
