

Requirements for Indoor Fireproof Electrical Distribution Boxes

Overview

3 to BS 7671:2008 (IET Wiring Regulations Seventeenth Edition), which was published in January and comes into effect on 1 July, will include a new regulation requiring consumer units and similar switchgear assemblies in domestic premises to have a non-combustible. ABB has expanded its range to include fire protection Mantle Enclosures, and Fire Protection Doors which, in addition to having a fire resistance duration that conforms to DIN 4102 Part 2 (F30/F90), also guarantee to check fire load (I30/I90) and maintain functionality (E30/E90). Fire-rated enclosures offer vital protection which allows systems to function during a fire. So, this blog will cover fire resistance in enclosure materials, standards, applications, and why they are needed for safety in high-risk areas. And it is here where there are requirements which cannot be implemented without further work. Choose the right box based on environment (indoor/outdoor), load capacity, and durability. Ensure safe placement: install in dry, accessible areas with good ventilation and at appropriate height (typically ~1.8m).
