

# **Safe vertical distance between optical fiber cable and 380V power line**

## Overview

---

The minimum safe distance from a power line depends on the voltage, the type of activity, and what's nearby, but the most widely recognized baseline is 10 feet for any person or piece of equipment near lines carrying up to 50,000 volts. The National Electrical Code establishes specific minimum distances when communications cables must run near power and light circuits.

by Jeanna Deese and Chris Rivas Power over Ethernet—it may be an old concept, but new applications continue to be identified that are redefining. In general, fiber optic cable can be installed with many of the same techniques used with conventional copper cables. Basic guidelines that can be applied to any type of cable installation are as follows: Conduct a thorough site survey prior to cable placement.
