

Spacing between 10kV busbars

Overview

Adequate spacing prevents short circuits and enhances system safety: Bare copper busbars: Minimum clearance $\geq 20\text{mm}$ to avoid phase-to-phase or phase-to-ground faults. Insulated busbars: Insulation allows for reduced clearance but must meet IEC 60664 or UL 746C dielectric strength. It defines the minimum distances between live parts and between live parts and earthed metal parts. From time to time we are asked what bus spacings are required by ANSI standards for switchgear. " And for general industrial control equipment, voltage range 301-600, shortest distance is shown as 1/2" with this same value being shown through oil or air over surface. A manufacturer of electrical automation panels is not required to use a certified busbar system or to subject it to short-circuit tests, provided that it complies with Table G3.
