

The optical power meter reading is not 0

Overview

Other general purpose light power measuring devices are usually called,, power meters (can be sensors or), or lux meters. A typical OPM is linear from about 0 dBm (1 milli Watt) to about -50 dBm (10 nano Watt), although the display range may be larger. If you are looking for a low cost device capable of saving and reporting take a look at the RP460 or. An optical power meter measures the strength of light traveling through a fiber optic cable, giving you a reading in dBm (decibels relative to one milliwatt). REF/dB key: Short press the dB to switch unit, click once nW/dBm/dB to enter the upper clear data, press and hold until REF is displayed on the screen, and set the current optical power as reference value, enter the relative optical power test mode, the screen will display the setted reference.
