

Two optical fibers of the switch are aggregated

Overview

Modern network infrastructure depends on fiber aggregation switches to combine several fiber optic links into one streamlined network connection. They are built to handle large amounts of data flowing through them without interruptions over long distances. An aggregation switch is a network device that consolidates traffic from multiple access switches, wireless access points, or other edge devices and forwards it to core switches or routers. From the perspective of what transceiver form factors support breaking out into multiple lower capacity.
