

# **What kind of wire should be connected to the top of the beam splitter**

## Overview

---

Moment connections: These resist bending, making them perfect for high-load situations. In the framed type, the beam is connected to the supporting member with fittings (short angles are common) attached to the beam web. They are usually hammered or clipped directly onto the beam, with an eyelet or aperture that allows wire or cable to be attached. Steel beam connections can be broadly categorized into two types: framed connections and seated connections. Beam connectors and locking pins might not dominate the headlines, but in the world of construction and engineering, they are the unsung heroes, holding together the very foundations of our endeavors. Think about it: every skyscraper you admire, every bridge you cross, and every roof that shelters.
