

# **What mode should be selected for single-mode fiber optic**

## Overview

---

In fiber-optic communication, a single-mode optical fiber, also known as fundamental- or mono-mode, is an optical fiber designed to carry only a single mode of light - the transverse mode. With a typical core diameter of 8-10 micrometers ( $\mu\text{m}$ ), single-mode fiber minimizes modal dispersion and enables signal transmission over distances of up to 100. Although they can do the same job in some instances, the different construction methods make each of them better suited to certain tasks and budgets. But not all fiber cables are created equal: multimode (MM) and single mode (SM) fibers are the two primary types, each engineered for specific use cases, from short-range data center connections to transcontinental telecom backbones.

## What mode should be selected for single-mode fiber optic

---

### Multi-mode optical fiber

---

Multi-mode optical fiber is a type of optical fiber mostly used for communication over short distances, such as within a building or on a campus. Multi-mode links can

### Single-Mode Fiber Cable Guide: Types, Specs & Selection

## Single-mode Fibers

---

Single-mode fibers (also called monomode fibers) are optical fibers which are designed such that they support only a single propagation mode (LP<sub>01</sub>) per polarization direction for a given wavelength.
