

# **What quota should be applied to a 42u standard network cabinet**

## Overview

---

A fully loaded 42U server rack cabinet has the capacity for over 3000 lbs of networking equipment, averages 5.7 kW per rail of power while fitting into a modest 78 inch tall package - and will still allow elevator access in most freight elevators. The right cabinet size depends on three things: how much equipment you have now, how much space you have available, and how much room you need for future growth. A rack space calculator is a specialized tool designed to help data center professionals, IT administrators, and network engineers determine the optimal placement and space requirements for equipment in server racks. If you're installing switches, UPS units, patch panels, or edge servers in an office, colo space, or small data hall—start with this: choose a 42U floor-standing rack with front/rear doors,  $\geq 60$  cm depth, and tool-less vertical mounting rails.
