

# What size cable should be selected for the jumper wires in the distribution box

## Overview

---

The supply side bonding jumper, which connects the raceway to the grounded bar, should be sized according to NEC Table 250. 102, particularly section C1, is a crucial reference for sizing supply-side conductors and system bonding jumpers. The cable should be selected such a way that at full load, the voltage drop should be within the permissible limits. Conditions of installation: Methods of installation, estimated thermal resistivity of soil, type of covering, type of armouring, the need if any for additional corrosion protection. Larger vehicles like trucks, SUVs, and diesel engines require thicker cables, typically 2 gauge or 1 gauge, to handle the higher cranking current. The following step-by-step guide will show you how to calculate the correct size of cable and wire, or any other conductor, for electrical wiring installations with solved examples in both British or English and SI Systems, i.
